

BA + Scrum Master Agent Flow

Customer-validated · TRD generation removed · AI restricted to reasoning-only tasks

● AI Reasoning

● Azure Service

● Hybrid

● User Gate / Checkpoint

PHASE 0 · INTAKE

AZURE DOCUMENT INTELLIGENCE

BRD Upload & Extraction

Text, tables, headings, embedded images extracted deterministically. OCR runs on diagrams/screenshots. No LLM involved.

PHASE 1 · ANALYSIS (AI REASONING ONLY)

AI

BRD Health Score + Contradiction & Gap Detection

Scores completeness/clarity/testability. Flags internal conflicts and missing sections. One-shot AI call per document version.

USER GATE

BA Reviews Health Report

BA confirms, edits BRD, or proceeds. Nothing downstream generates until this checkpoint clears.

PHASE 2 · SPECIFICATION (REDESIGNED)

~~Technical Requirements Document (TRD) Generation~~

✕ REMOVED

Customer feedback: TRD ownership sits with Architects/Tech Leads, not BAs. Generating one without confirmed tech stack, integration patterns, or system landscape produced generic, low-trust output.

AI

Functional Specification (BA-Owned, Tech-Agnostic)

Business rules, process flows (as-is/to-be), data dictionary, glossary, prioritized requirements. Zero technology assumptions made.

IF NO TECH CONTEXT GIVEN

→ Functional Spec is Final Output

Handed to Architect/Tech Lead as-is. Agent makes no technical claims.

IF TECH CONTEXT EXPLICITLY PROVIDED

→ Architect Handoff Notes (Draft, Optional)

Clearly labeled "input for architect review" — never a final TRD. Gated behind explicit stack/cloud/integration input.

PHASE 3 · BACKLOG GENERATION

AI

User Stories + Acceptance Criteria (Given/When/Then)

Generated from functional spec only — no architecture inference. Epic → Feature → Story hierarchy with story points + rationale.

HYBRID

Definition of Ready Check + Sprint Allocation

AI flags incomplete stories; Azure Function does the actual sprint-bucket math (bin packing on velocity, pure logic).

PHASE 4 · APPROVAL

ACS + LOGIC APPS

Approval Package Dispatch & Tracking

Functional spec + backlog summary sent to stakeholders. APPROVED / REJECTED / TIMEOUT / PARTIAL handled by Logic Apps state machine — no AI involved.

AZURE DEVOPS REST API

Backlog Creation in ADO

Sequential Epic→Feature→Story→Task creation with hierarchy links, tags, area/iteration paths. Pure API orchestration.

PHASE 6 · CONTINUOUS SCRUM MASTER OPERATIONS

Runs every sprint cycle

Standup Synthesis [AI]

Raw notes/Slack → structured summary + blocker list

Blocker Tracking [Azure Fn]

Logs, ages, auto-escalates past threshold

Burndown/Velocity [Azure Fn]

Pulled directly from ADO data, pure math

Retro Facilitation [AI]

Clusters feedback themes, tracks action items

Status Reports [Hybrid]

AI drafts RAG summary, ACS sends to stakeholders

Scope Drift Detection [Azure Fn]

ADO webhooks vs RTM, flags silently changed scope

feeds back into Phase 3 for next sprint's backlog refinement

PHASE 7 · RELEASE READINESS

HYBRID

UAT Scenarios + Go-Live Checklist

AI drafts UAT test scenarios from acceptance criteria. Azure Test Plans API stores/manages them. Checklist generated from RTM completion state.
